

Are you looking to save on infrastructure costs? Are you looking to implement real-time product simulation with 24/7 availability? SolveIT's unique methodology enables non-scenario based product simulation provides real-time experience. Simulation application is being used by training and for sales demo ensuring high availability.

Our industry-best simulation applications help you free-up hardware space to run your core business applications. Before we implement an application, we understand what the actual product does and how it performs and try to mimic the real-time settings of the products. Our implementations have helped our customers train their employees without compromising on the user experience. We made it possible by gaining first-hand experience of how the application interacts with the user before beginning to simulate the product in real-time. Our simulation applications retain the user experience, framework and the functionalities of the simulated products and that has made SolveIT the preferred partner for several customers looking to simulate.

Our simulation applications are based on Java and XML-store as the back-end platform and are currently being used by EMC Control Center and Navisphere Suite of Products.

### **Salient Features of SolveIT suite of solutions:**

- A tested methodology to custom develop applications that mimics complex processes.
- Retains user interface, framework, and functionalities of existing applications.
- Frees up hardware to concentrate on core business processes.
- Saves infrastructure costs.
- Makes scheduling demos-at-will possible.
